Cross Department Impact

AI Signals

Executive Scorecard

Task 14: AI Signals Dashboard

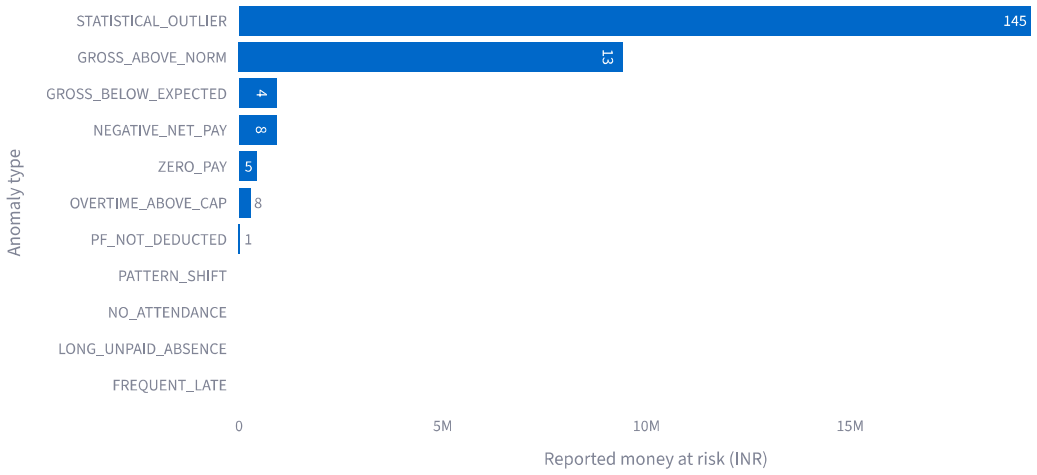

This dashboard presents AI-generated anomaly signals, workforce forecasts and attrition-risk indicators. All outputs require human review.

Flagged anomalies	Reported money at risk	High attrition-risk signals	Medium attrition-risk signals
405	₹31,421,239	43	86

Money at risk is the sum of reported anomaly exposures. It may include overlapping records and is not confirmed financial loss.

1. Anomalies by Type

This chart ranks flagged anomaly categories by their reported financial exposure. Categories with zero reported money at risk are also included so operational signals are not hidden.

AI-generated, for human review

Business interpretation: Statistical outliers and gross-pay above-norm signals account for the largest reported exposures. Finance or payroll teams should investigate the underlying records before taking corrective action.

Anomaly Summary

reason_code	records	money_at_risk
STATISTICAL_OUTLIER	145	₹19,432,986.26
GROSS_ABOVE_NORM	13	₹9,417,924.27
GROSS_BELOW_EXPECTED	4	₹927,063.83
NEGATIVE_NET_PAY	8	₹909,114.81
ZERO_PAY	5	₹431,262.75
OVERTIME_ABOVE_CAP	8	₹272,767.51
PF_NOT_DEDUCTED	1	₹30,119.64
FREQUENT_LATE	3	₹0.00
LONG_UNPAID_ABSENCE	43	₹0.00
NO_ATTENDANCE	50	₹0.00

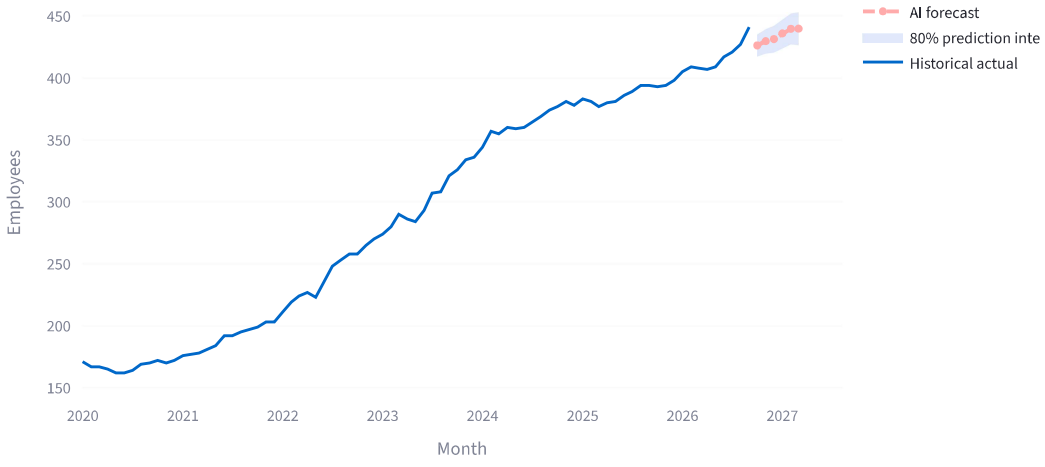

---

2. Workforce Forecast vs Actual

The forecast uses the company-wide ALL department series. The shaded region represents the model's 80% prediction interval.

Select forecast metric

Ending Headcount

AI-generated, for human review

Business interpretation: Historical actuals are shown separately from future model forecasts. The shaded band represents the model's 80% prediction interval, not a guarantee that actual results will fall inside it.

Model: trend-seasonal-baseline-0.1 | Method: linear trend (36m) + half-strength seasonality | Trained through: 2026-09

---

3. Forecast Error Analysis

Forecast error can only be calculated when actual data is available for the same month and metric.

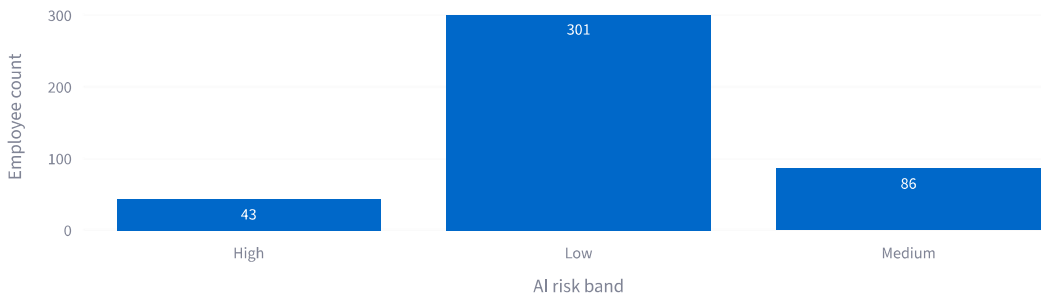

Forecast Month	Forecast Value	Actual Value	Absolute Error	Error Percentage	Status
2026-10	426.3	None	None	None	Actual not available yet
2026-11	429.7	None	None	None	Actual not available yet
2026-12	431.4	None	None	None	Actual not available yet
2027-01	436	None	None	None	Actual not available yet
2027-02	439.7	None	None	None	Actual not available yet
2027-03	439.8	None	None	None	Actual not available yet

No forecast error can be calculated yet. Actual data ends in September 2026, while the forecast starts in October 2026. There are zero overlapping months.

---

4. AI Attrition-Risk Signals

This section shows the number of employees in each model-generated risk band. Employee-level details are intentionally not displayed.

AI-generated, for human review

HR interpretation: These are model-generated support signals, not confirmed predictions of employee resignation. HR should review context and speak with employees appropriately. The model must never be used as the sole basis for employment decisions.

Risk model version: attrition-logreg-baseline-0.1

Task 14: Important Limitations

- Anomaly flags require investigation and are not proof of fraud or error.
- Reported money at risk may contain overlapping exposures.
- Forecasts are model estimates, not guaranteed future outcomes.

- The 80% prediction interval communicates uncertainty.
- Forecast accuracy cannot be evaluated until matching actual months arrive.
- Attrition-risk bands are support signals for human review, never decisions.

Task 14 AI Signals Dashboard loaded successfully.
